CHROMATIN-REMODELING MACHINES.
-!- SUBUNIT: NURF IS COMPOSED OF FOUR SUBUNITS; A 215 KDA PROTEIN, INTEATION SWITCH (ISWI), NURF-55, AND NURF-38.
-!- SUBCELLULAR LOCATION: NUClear (Potential).
-!- SIMILARITY: BELONGS TO THE SNF2/RAD54 HELICASE FAMILY. SNF2L

SUBFAMILY.

-!- FUNCTION: THIS MAGNESTUM DEPENDENT ENZYME CATALYZES THE HYDROLYSIS

OF ATP COUPLED WITH THE TRANSLOCATION OF CALCIUM FROM THE CYTOSOL

INTO THE ENDOPLASMIC RETICULUM (BY SIMILARITY).

-!- CATALYTIC ACTIVITY: ATP + H(2)O + CA(2+)(CIS) = ADP + PHOSPHATE +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                BINDING DOMAIN, WHICH BINDS CALMODDLIN IN A CALCIUM-DEPENDENT FASHION (BY SIMILARITY).
SIMILARITY: BELONGS TO THE CATION TRANSPORT ATPASES FAMILY (E1-E2 ATPASES). SUBFANTILIS IIB.
CAUTION: THE SEQUENCE CA43665 DIFFERS FROM THAT SHOWN DUE TO WRONG EXON BOUNDARIES PREDICTED FROM THE GENOMIC SEQUENCE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ENZYME REGGILATION: ACTIVATED BY CALMODULIN (BY SIMILARITY). SUBCELLULAR LOCATION: Integral membrane protein. DOMAIN: THE N-TERMINUS CONTAINS AN AUTOINHIBITORY CALMODULIN-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Hydrolase; Calcium transport; Transmembrane; Phosphorylation;

"Cloning and characterization of a murine band 3-related cDNA from kidney and from a lymphoid cell line.";
J. Biol. Chem. 263:17092-17099(1988).
COLLAGEN-CONTAINING SUBSTRATA.
SUBGELLULAR LOCATION: TYPE I membrane protein. Cell wall.
SIMILARITY: TO OTHER STREPTOCOCCAL AND STAPHYLOCOCCAL PROTEINS
IN THE REGION OF THE MEMBRANE ANCHOR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Lecanda J., Urtasun R., Medina J.F.; ^{\prime\prime} Molecular cloning and genomic organization of the mouse AE2 anion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

SUBCELLULAR LOCATION: Integral membrane protein.

ALTERNATIVE PRODUCTS: 5 isoforms; a (shown here), bl, b2, c1 and c2; are produced by alternative splicing.

TISSUE SPECIFICITY: Isoform a is widely expressed at similar levels in all tissues examined. Isoforms bl and b2 are predominantly expressed in stomach although they are also detected at lower levels in other tissues. Isoform c1 is stomach-specific. Isoform c2 is expressed at slightly higher levels in lung and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PALMITATE (BY SIMILARITY).

J. Hum. Genet. 69:635-640(2001).

-!- FUNCTION: RECESSIVE ACTIN-BASED MOTOR. REQUIRED FOR STRUCTURAL INTEGRATY OF INNER EAR HAIR CELLS (BY SIMILARITY).

-!- DISEASE: Defects in MYO6 are the cause of an autosomal dominant form of nonsyndromic sensorineural deafness (DFNA22). The deafness is progressive and postlingual, with onset during childhood (8 to 10 years of age at onset of symptoms; 6 to 8 years of age at onset of first audiometric abnormalities). By the age of approximately 50 years, affected individuals invariably have profound sensorineural deafness.
                                                                                                                                                                                                                                                                              Avraham K.B., Hasson T., Sobe T., Balsara B., Testa J.R., Skvorak A.B., Morton C.C., Copeland N.G., Jenkins N.A.;
"Characterization of unconventional MYO6, the human homologue of the qene responsible for deaffness in Snell's waltzer mice.";
Hum. Mol. Genet. 6:1225-1231(1997).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MEDLINE-21375673; PubMed=11468689; Melchionda S., Ahiturv N., Biscepila L., Sobe T., Glaser F., Rabionet R., Arbones M.L., Notarangelo A., Di Torio E., Carella M., Zelante L., Estivill X., Avraham K.B., Gasparini P.; "MYG6, the human homologue of the gene responsible for deafness in Snell's waltzer mice, is mutated in autosomal dominant nonsyndromic hearing loss.";

submitted (APR-2001) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: THIS ENZYME IS INVOLVED IN NUCLEOTIDE METABOLISM: IT PRODUCES DUMP, THE INTRACELLULAR CONCENTRATION OF DUTP SO THAT URACIL CANNOT BE INCORPORATED INTO DNA (BY SIMILARITY).

-!- CATALYTIC ACTIVITY: dTTP + H(2)0 = dUMP + diphosphate...
-!- PATHWAY: DE NOVO SYNTHESIS OF THYMIDYLATE...
-!- SIMILARITY: BELONGS TO THE DUTPASE FAMILY.

Sinorhizobium meliloti strain 1021.";
Proc. Natl. Acad. Sci. U.S.A. 98:9877-9882(2001).
-!-FUNCTION: Converts molybdopterin precursor Z into molybdopterin.
This requires the incorporation of two sulfur atoms into precursor Z to generate ae dithiolene group (By similarity).
-!- PATHWAY: Molybdenum cofactor biosynthesis.
-!- SUBUNIT: Heterodimer of 2 moaD subunits and 2 moaE subunits (By
